## WHAT IS LSD?

Lumpy Skin Disease (LSD) is a viral disease that affects cattle, and can lead to severe health issues and economic losses.

**Successful control and eradication of LSD relies on early detection of disease, followed by a rapid and widespread vaccination campaign.**

Cattle of all ages can be affected by LSD.

**LSD is not dangerous for humans**, but they play vital role in early detection and prevention.

LSD have severe clinical signs that includes visible nodules on the skin, fever, temporary reduction in milk production, temporary or permanent sterility in bulls, abortion in cows, and occasionally death.

# STOP LSD!

## HOW IS LSD TRANSMITTED AND SPREAD AMONG CATTLE?

- LSD spreads primarily through blood sucking insects like certain species of flies, mosquitoes, and ticks, which act as vectors for the virus.
- It is crucial to promptly report to your veterinarian any changes in the health and production of your cattle.

## WHAT ARE THE CLINICAL SIGNS OF LSD?

After infection, clinical signs vary:
